

Snake Game Project

Initial Situation

During a project week, I decided to create my first personal website using HTML and CSS. This was my initial foray into web development, and I had very little prior experience with these technologies. The goal was to design a simple, visually appealing website that would serve as an introduction to myself and my interests.

Goal

The primary goal of this project was to create a functioning website that could display personal information, such as a brief biography, interests, and social media links. I aimed to structure the website in a clear and organized way, with navigation links to different sections like travel, games, and contact information.

Implementation

I started by laying out the structure of the website using HTML, creating different sections for the

homepage, personal background, and hobbies. I then applied CSS to style the website, focusing on

Result

The project was a success, and I was able to build a fully functional website that met all my initial goals. The site includes a personal profile, with sections that reflect my interests in fitness, travel, and gaming. Although simple, the website is visually appealing and provides a clear and organized way to present information.

Insight

This project provided me with a solid foundation in HTML and CSS. I gained valuable skills in structuring web pages, applying styles, and understanding the basics of responsive design..
